

Supplemental Figure 1. Preserved total immune cell numbers in aged naïve spleens. Digested single cell suspensions from young and aged spleens were gated on alive, signal cells that are CD45+. Data are from one representative of three independent experiments. Data was analyzed for statistical significance using a two tailed T-test $n=3-4$ mice per group, error bars =+SEM.

Supplemental Figure 2. Attrition of Splenic T cell zone. A. Representative isosurfaces of CD8a (yellow), B220 (blue), CD31 (red) in splenic white pulp. Quantification of isosurface area for B. CD8a, C. B220, and D. CD31. Data are pooled from two independent experiments n=6 mice per group. Statistical significance was determined by students T-test, error bars = \pm SEM.
