

Supplemental Figure 1: IκB is delayed by LPS pre-treatment and this coincides with Siglec-E expression. BMDMs were untreated (lanes 1-6) or tolerised with 100ng/ml LPS (A&B) or 25 μ g Poly(I:C) (C) for 24 hours. Cells were then re-stimulated with the indicated ligands for the stated times and whole cell lysates were assessed for IκB, Siglec-E and equal loading was confirmed by immunoblotting for γ -tubulin. The data is representative of 3 independent experiments.
