

## Supplementary Figure Legends:

### Supplementary Figure 1:

HEK293 cells were transiently transfected with either TLR5, NFkB-luc and pHRG-TK (TLR5+) or just NFkB-luc and pHRG-TK (TLR5-) then stimulated with flagellin (5-50 ng/ml) in the presence or absence of Fel d 1 (10 ng/ml). Stimulation in the absence of transfected TLR5 enables the contribution of endogenous TLR5 to be determined. Data normalized against unstimulated control are shown as the mean and s.e.m of one representative experiment from duplicate experiments. No statistically significant difference was observed between stimulation in the absence or presence of Fel d 1.
