

Helminth-conditioned dendritic cells prime CD4⁺ T cells to IL-4 production *in vivo*. Connor *et al.*

Supplementary Figure 1 and Legend

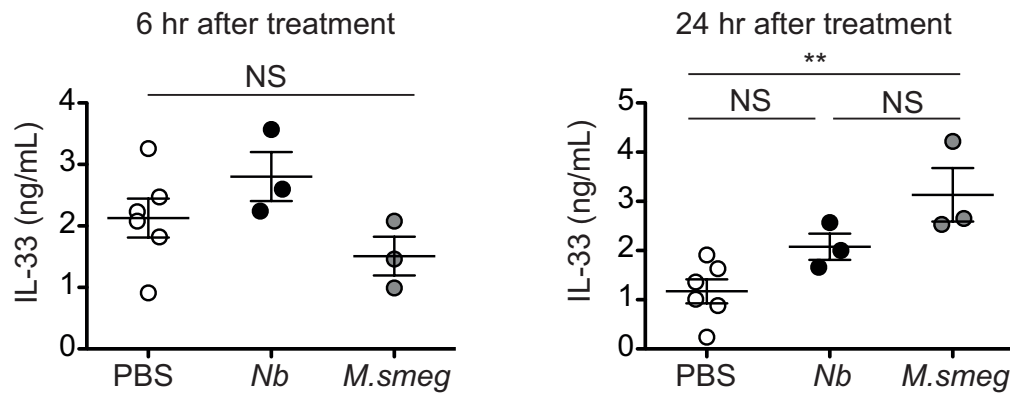

Figure S1: IL-33 protein levels in the skin of *Nb*-treated mice

Mice were injected i.d. into the ear pinna with 600 non-viable L3 *Nb*, 2×10^6 CFU heat-killed *Msmeg*, or PBS. Ear lysates were prepared at the indicated time points after treatment, and total IL-33 protein contents were determined by ELISA. Graphs show mean \pm SEM for 3-6 mice/group; each symbol corresponds to one mouse. *P* values were determined using one-way ANOVA with Bonferroni post-test, ** $p < 0.01$.
